

BLUMENTAL
CLINIC

Modern and High-Tech Varicose Vein Clinic

Modern world technologies, professional approach, and non-invasive surgical procedure

OUR CLINIC

We are the first specialised clinic for treatment of varicose veins, and other venous conditions. Our surgeons are working with high-tech equipment that enables them to carry out a wide range of surgical and cosmetic treatments. Thus, ensuring the treatment and removal of varicose veins is faster, more effective, and more convenient.

TECHNICAL EQUIPMENT

At our specialised clinic we, as the only ones in Slovakia and Czech Republic, are using the latest modern method CL and CS (Cryolaser and Cryo Sclerotherapy). A combination of cryolaser QUANTA light C EVO with cooling appliance Zimmer Cryo 6 using sclerosant solution and high level of cooling. Sclerotherapy for this kind of feeder vein is done by high-tech infra camera VeinViewer Visio2.

AVAILABLE TREATMENTS

COSMETIC AND AESTHETIC TREATMENTS

Thin thread veins directly under the skin on your legs could be the first stage of chronic varicose vein disease. Usually, they are not visible, but with time, they can come to the surface and get swollen and slightly inflamed. These veins are purple, dark blue or red in colour.

Do not underestimate them!

AVAILABLE TREATMENTS:

- Permanent Cosmetic laser treatment of spider veins and reticular veins
- Cosmetic microsurgical removal of varicose veins – Mini Phlebectomy
- Ultrasound-guided sclerotherapy
- Complex angiography test (including ultrasound mapping and Ankle-Brachial Index measurement)

Do not wait for serious symptoms of varicose veins conditions to develop!

SURGICAL TREATMENTS

Thin thread veins could develop to chronic varicose veins disease, which might require a surgery. By using an **ultrasound diagnostic system Canon XARIO 100MxUSG** as a guide, we map the veins to be treated and mark them on your skin. Then, the guide wire we inserted under your knee is replaced with **Endovenous Laser Treatment (EVLT)**.

EVLT enables fast and effective treatment of varicose veins by using the **laser generator LASOTRONIX SMART M**. Generator is connected by radial laser wire with a diameter of 400 micrometres. The wire emits minimal radiation, which seals the vein and enables its absorption.

The procedure is carried out under the local anaesthetic and by using an ultrasound as a guide. We also provide various post-operative or post-surgery treatments.

OUR TEAM OF SURGEONS

We select every member of our team very carefully, making sure that our medical staff and surgeons are well trained in the latest new trends and technologies. In addition, we require every surgeon to have several years of experience in varicose veins conditions.

MUDr. Vladimír Kovács, PhD. MHA
Consultant

MUDr. Renáta Talapková, PhD.
Vascular Surgeon

MUDr. Lenka Bajuzíková
Surgeon
